Data Visualization & basic transformation

Before this, going to do some very basic data cleaning

CLEANING DATA

1. Remove ID ID is not really relative data here. It just identifies the rows.

```
housedata<-select(housedata, -c(Id))
```

2.. MSSubClass to factor. MSSubclass is actually categorical - represented as numeric. Need to change to factor.

```
housedatac$MSSubClass<-as.factor(housedatac$MSSubClass)
```

MSSubClass: Identifies the type of dwelling involved in the sale.

- 20 1-STORY 1946 & NEWER ALL STYLES

3. Dividing into numerical and categorical columns to visualize some data.
- Numeric

housedata_num<-housedatac[, nums]

Many of the distributions are skewed - including salePrice Log transformation would be beneficial.

Skewness Test

Originally used Shapiro wilk test, but this only works well with $n < 50$ and thus all my distributions showed as not-normal. Skewness - between -0.5 to 0.5 normal, absolute value between 0.5 and 1 moderately skewed. Abs value above 1 is highly skewed. Kurtosis - Kurtosis tells you the height and sharpness of the central peak, relative to that of a standard bell curve.

Plot numerical 2 - Boxplot to check outliers

An outlier is defined as above 1.5 interquartile range above the upper quartile(Q3) and below 1.5 of lower quartile(Q1). Looking at the boxplot, there are too many outliers. Many are because the distribution is skewed, and some because majority of the distribution are packed into very small range (variance is very small).

```
par(mfrow=c(1,5))
```

The mapply() function stands for 'multivariate' apply. Its purpose is to be able to vectorize arguments to a function that is not usually accepting vectors as arguments. In short, mapply() applies a Function to Multiple List or multiple Vector Arguments.

```
mapply(boxplot,data.frame(housedata_num),main=colnames(housedata_num) )

Looking through these values, most of them looks to be biproduct of skewed distribution or extremely small variance. Will look this into a little more after cleaning up the data using cook's distance.

Check to see relationship with response variable - house price VS ind. variables.

```
par(mfrow=c(2,3))
for (i in 2:79)
(
plot(housedata[,i],housedata$SalePrice, las=2, main=colnames(housedata[i]),
xlab='', col='grey')
)
```

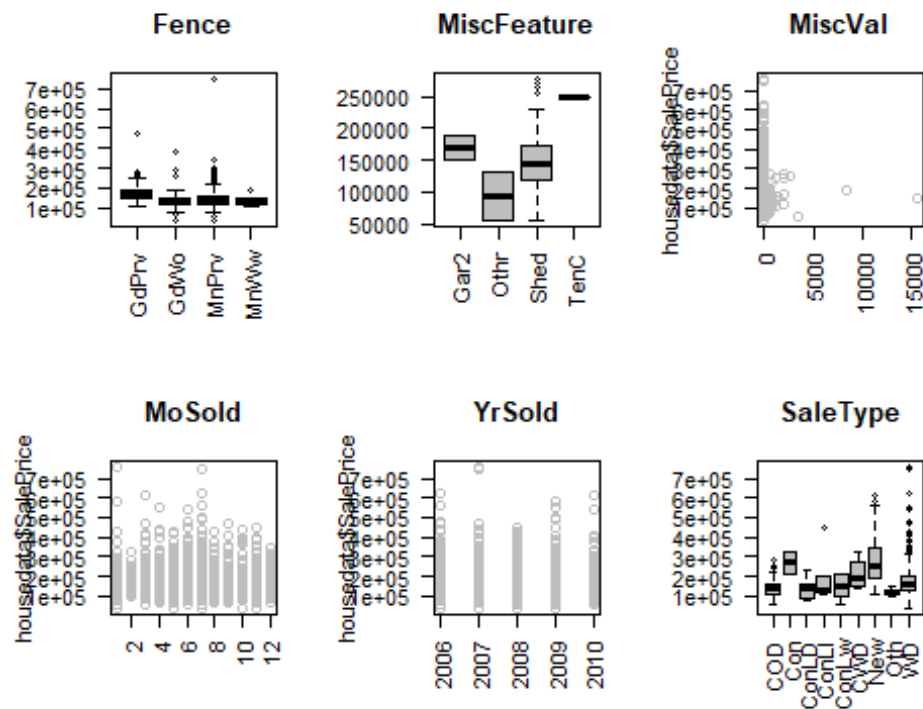

Can see definite relationships here. House Prices increase with Lot Frontage, Lot Area, Overall Quality, Year Built, Year Remodel, BsmtFinSF1, TotalBsmtSF, X1stFlrSF, X2ndFlrSF, # of FullBath, TotRmsAbvGrd, KitchenQual, GarageYrBlt, GarageCars, GarageArea, WoodDeckSF, etc.

Checking Correlations between Independent Variables

Using spearman because many of our variables are not normal.

```
cor(housedata_num, use="complete.obs", method='spearman')
```
